

# GTJ.v.4.4.4-Extension (Latest)

This release introduces improvements and bug fixes designed to streamline your workflow and enhance productivity.

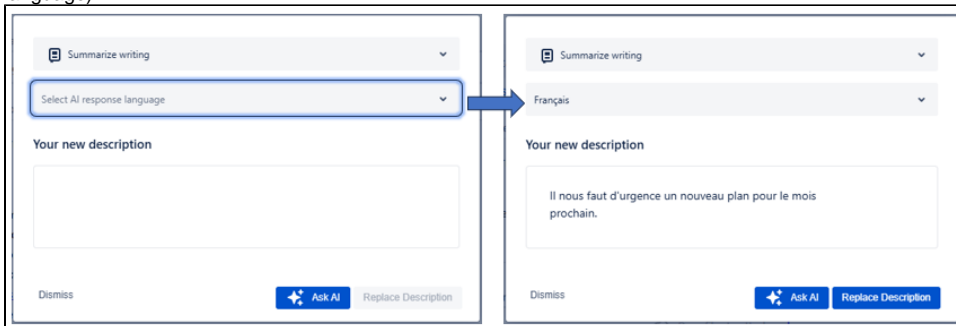

## Adding Email URL as a WebLink

- **Email-to-Ticket Web Links:** When a ticket is created from an email, the **original email link** is now **added** to the **WebLink** section on the ticket (if this feature is supported on your Jira project).
- The email's subject will be used as the link text, making it easier to reference the source.

## AI Content Refiner Language Support

- Users can now specify the desired language for the AI Content Refiner's response, giving more control. (Default AI Output is the English language)

## Bug Fixes:

- Fix and support translation for the German language
- Enhancement for the Email Smartness feature
- Various minor bug fixes, especially login and license issues for DC instances Jira 10
- Login Jira URL Autofill: The Jira URL field on the login screen will now be automatically filled with the most recently used Jira URL from your previous login.
- Multiple Ticket Creation Improvement: if a ticket already exists, the system will now display only an informative message with the "Existing issues" instead of loading the full create form.
- Fix for AI Features - DC Jira 10: When users attempt to use AI features and send any prompt, a notification message will be shown informing them that the AI feature is disabled because the Smart AI for Jira addon is not installed (or has an invalid license)

We'd love your feedback! Please let us know how these updates enhance your workflow.
