

V5.2.2 - Latest

This release includes:

- An important fix that restores the proper display and handling of **inline images and attachments** in Jira when creating Jira tickets from emails that contain embedded media or attached files. We've upgraded the integration to use **Microsoft Graph API**, ensuring reliable rendering and compatibility with Microsoft updates.
- The returned summary in AI Create is fixed to be returned in the same language as the email.

Why This Update Was Needed (MS Graph API)

Microsoft has begun **deprecating parts of the Exchange Online API** across Microsoft 365 tenants. As a result, certain features relying on these older endpoints were impacted, including:

- Inline images failing to display correctly in Jira
- Attachments not appearing or rendering in Jira

What We Changed

- Migrated attachment and inline-image retrieval to **Microsoft Graph API**, Microsoft's modern and supported API.
- Updated request handling to ensure all media content (attachments, embedded images) is fetched through Graph.
- Improved rendering logic in Jira so images and attachments now display correctly.

How To Connect To Microsoft Graph - [Action Required](#)
